

It's question about our future.

Economic situation of nations is highly depending on energy. It is widely proven. For example James Watt's improvement of a steam engine helped British to grow as a most powerful imperium of the time. Unfortunately, in a long run Watt's invention caused the biggest problem of our time, climate change. Thus it is named energy paradox.

It is also known that energy is closely connected to water and food. It is assumed that related wars will not be rare. Climate migration is could also be possible.

Until power storage is not solved in a sustainable way, solar and related energy solutions don't give an answer.

What to do?

There is a fundamental force. Unfortunately it is a weak force, say energy experts. On the other hand it keeps the universe together. How strong it should be? Could we exploit it?

RecyclingEnergy may not be the best one, but the only one.

It's question about our future. We're acting out of necessity due to climate change. We must get rid of combustion, especially fired power plants which produce most of CO2. Got the point. Conservation of energy means that all energy is RecyclingEnergy instead of energy generation, which does not exist. RecyclingEnergy might not be the best one, but it is the only one. Powerier infinitely and autonomically powers anywhere and anytime, on-peak and off-peak, unlike solar, wind, wave/tidal etc. which are not renewables because the Sun is not renewable. GraviEnergy exploits fundamental force, which nobody or nothing can escape. It's emission-free but not a perpetual motion machine. Zero-0input fuel/feedstock supply enables constant and autonomic operation, underground and underwater, as well - the most secured power generation. It powers vehicles locally "on the street" basis, wirelessly as well. First-ever - disruptive - NoEnergyWar - Unlike James Watt, EnergyParadox without sacrifices.

RecyclingEnergy (RE) operates with customers as a turnkey project integrator.

Possible models include joint ventures, strategic partnerships, Build-Operate-Own (BOO) and Private Finance Initiative (PFI) and others.

Within these frameworks, RE accepts responsibility for building the project (including securing required financing), and then operating the facility under a long-term concession (ranging from 10-100 years).

The contract includes the sale of the end-product produced by the plant to customers for a price established in the contract.

Gravi Energy

4+g

- Anywhere
- Anytime
- No fuel supply
- Infinite
- Emission-free
- Non-sacrifices
- Power
- Pneumatic
- Kinetic Energy

Element Segregation

Element Segregation Concept has provenly segregated elements from flue gas and ash. They are converted to fertilizer and nutrients, and recycled.

Waste To Energy

- Incinerator
- Flue gas and ash cleaning by Element Segregation

Latent Heat Pump

- 100% thermal efficiency
- COP 33 summer
- COP 15 winter
- 30-70% energy savings
- Non-freezing
- Free evaporative cooling
- Non-drain
- Non-microbes/self-cleaning

BeStructure

- Hermetic
- Sandwich
- Self-supporting
- Any shape
- Non-condensing
- Non-microbes
- Light
- Without glue
